

Bacteria exchange

Idea: The aim is to find an answer to the question of how foreign bacteria react to each other. Here are two ideas for experiments:

The Kiss: The bacteria from the oral cavity of two people are cultivated on separate culture media. After a prolonged tongue kiss, a new swab is taken from each person.

Oral sex: The bacteria from the intimate area and from the oral cavity of two people are cultivated in separate Petri dishes. After oral sex, all swabs are repeated.

Will the bacterial cultures from the same areas look different after contact? Will the bacteria from the two people be able to be found again? Or will the cultures show a completely new picture?

About the medium: see "bacteria portrait".

Presentation: Exhibition. Presentation of photos.
