# WebApp

- web application
- application accessed over network such as Internet or Intranet
- using HTML5, CSS, JavaScript, jQuery, jQTouch

**PROS** ease of development, cross-device compatibility,  
no AppStore approval needed, easy publishing/updates

**CONS** only a few APIs for device features (hardware access) available in JS,  
no AppStore, hard to sell your app

## HTML5

- next HTML standard
- currently under development
- new features (offline cache, local and session storage, client-side database)

## CSS (Cascading Style Sheets)

- style sheet language
- to separate content and design

## JavaScript or JS

- scripting language

Objective-C or ObjC

- object-oriented programming language
- Smalltalk-style messaging to C programming language
- used primarily in Mac OS X and iOS

Xcode

- development environment
- Mac OS X installation dvd
- contains Apple Developer Tools

Interface Builder

- application to construct GUI

Cocoa Touch

- framework for building iOS apps
- object-oriented API (application programming interface)

# PhoneGap: Convert a WebApp into a native App

- open source development framework for building cross-platform mobile apps
- container for WebApp
- creating a native App with WebApp in it
- download via AppStore (Android Market etc.), then offline access
- provides JS access to otherwise inaccessible device APIs  
(accelerometer, camera, contacts, location, sound, telephony, orientation, vibration)

**PROS** ease of development and still take advantage of core features in iPhone/iPod touch,  
cross-device compatibility (WebApp can be converted to various platforms)

**CONS** problems with complex functionalities
